Before & After

What Is ThermiRF®?

ThermiRF is the first aesthetic technology that uses micro-invasive thermistor-regulated radio frequency energy to achieve desired cosmetic results. The ThermiRF system uses a tiny treatment probe to gently heat specific tissues to a pre-determined therapeutic temperature to achieve a cosmetic effect.

How it Works

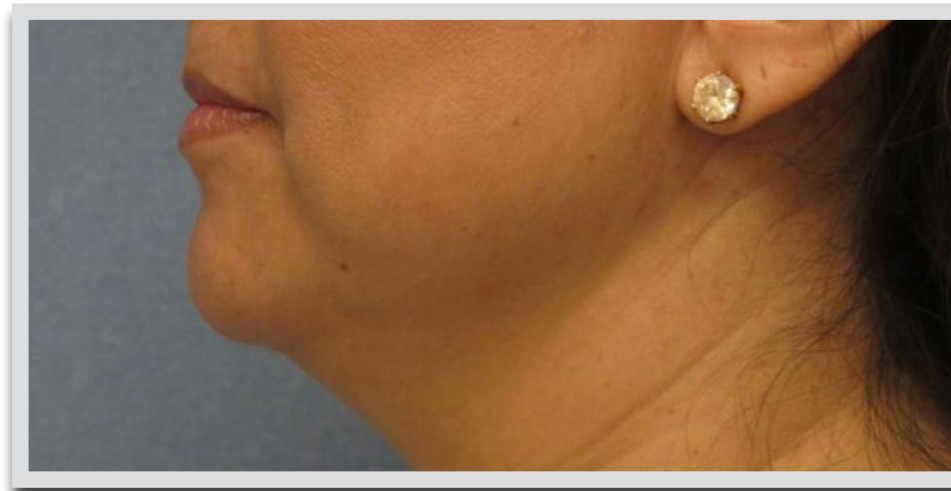

With ThermiRF, your surgeon applies a controlled amount of thermal energy to targeted tissue. The tip of the tiny probe provides constant feedback of the actual temperature during treatment, while an infrared camera is used to monitor skin temperature to ensure that your treatment is both safe and effective.

ThermiRF provides a truly precise and safe delivery system that acutely applies the proven “science of heat” to achieve cosmetic results.
